

Adding Demo Mode Audio Warning

Purpose

On CommCare for Java Phones, when a user enters demo mode, a warning appears explaining that this is for practice only, not real data. This text can be confusing for some users, especially low-literate users.

This feature allows you to add an audio clip to the application. The audio clip will play when the user enters demo mode.

Note that this is for Java Phones only, not Android. It is part of the UI translation system, so you can have a different audio clip play for each translation.

Instructions

1. Obtain the audio message you want to play in any languages that you want. We recommend using .mp3 files.
2. Enter the translation key *demo.warning.filepath* in the UI translations section of HQ (see [UI translations in CommCare](#).)
3. For the value, enter the location where you will put the .mp3 file on the phone's sd card. See [Multimedia in CommCare](#) - remember you need to start the filepath with *jr://file* (which means the SD card) and end it with the name of the file .mp3.
4. When you install the application, place your audio file on the phone's SD card in the exact location you defined in step #3
